

Using Kaizen to Align Information Systems with Business Processes

Laura Jackson

Director, Product Data Management Phifer, Inc.

A Little About Me

BS-IE, MS-HRM University of Alabama

Manufacturing Engineer with Delphi Automotive

SAP Master Data Manager

CPI Engineer

Currently responsible for the maintenance, accuracy, and continuous improvement of business information

A Little About Phifer, Inc.

Key Products

Drawn Wire

Metal & Fiberglass Insect Screening

Solar Control

Designed Fabrics

- Privately owned textile company
- Founded in 1952
- Headquarters in Tuscaloosa Alabama
- 1200 Employees

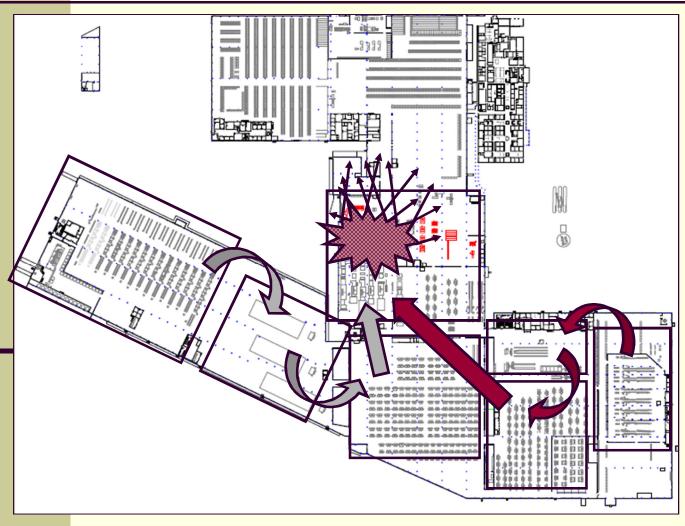

Presentation Agenda

- History behind Phifer's problems
- What is Kaizen?
- Special challenges with Business & IT process Kaizen Events
- Phifer Kaizen example with specific event tips
- Lessons Learned

The Old Days

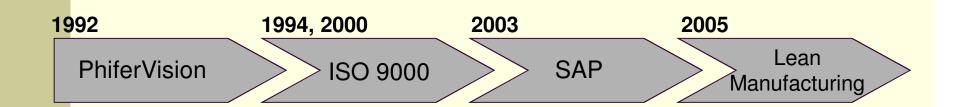

Previous Layout

- Isolated departments of similar equipment
- Material flow controlled entirely by scheduling
- No visibility between raw materials and finished goods
- Department managers were equipment "experts"
- "We run the work order and send it on" mentality

Improvement Initiatives

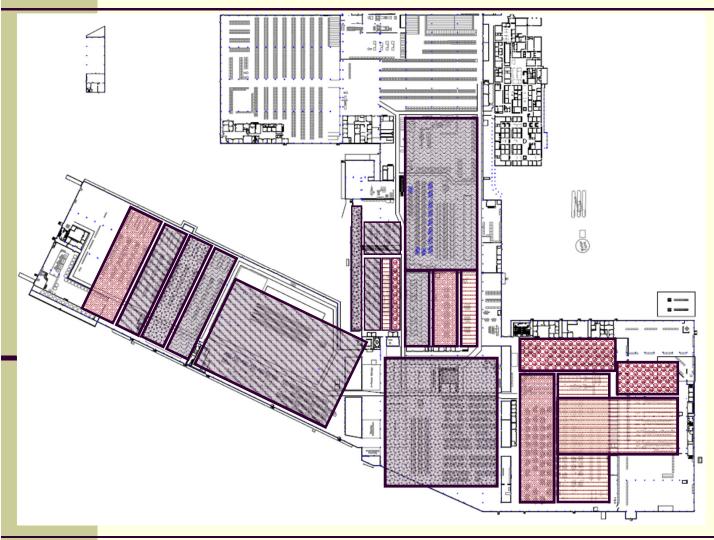

- Custom Products
- Commodity Products
- Compete Globally

Today

Current Layout

- Organized in to Product Lines with dedicated equipment aligned to a specific market segment
- Product line scheduler controls flow of raw material to finished goods; often with kanban
- Product Line
 management
 responsible for all
 processes and people
 within the product line
- "Our products go to customer X, Y, & Z" mentality

Kaizen Success

Results of over 300 Kaizen Events:

- 22% increase in gross profit (still had profit sharing in 2009!)
- 27% increase in overall productivity
- 60% decrease in OSHA recordable incidents;
 50% decrease in overall Incident Rate;
 44% decrease in medical cost/employee

The Problems

- Physical process improvements were being limited by the "system"
- Difficulties in linking product cost with process improvement

SAP cost vs SQDC metrics

 Nobody owned or understood the data...or really wanted to

The Problems

The Solution

An IT process is still a process...

...and we use Kaizen to improve all of

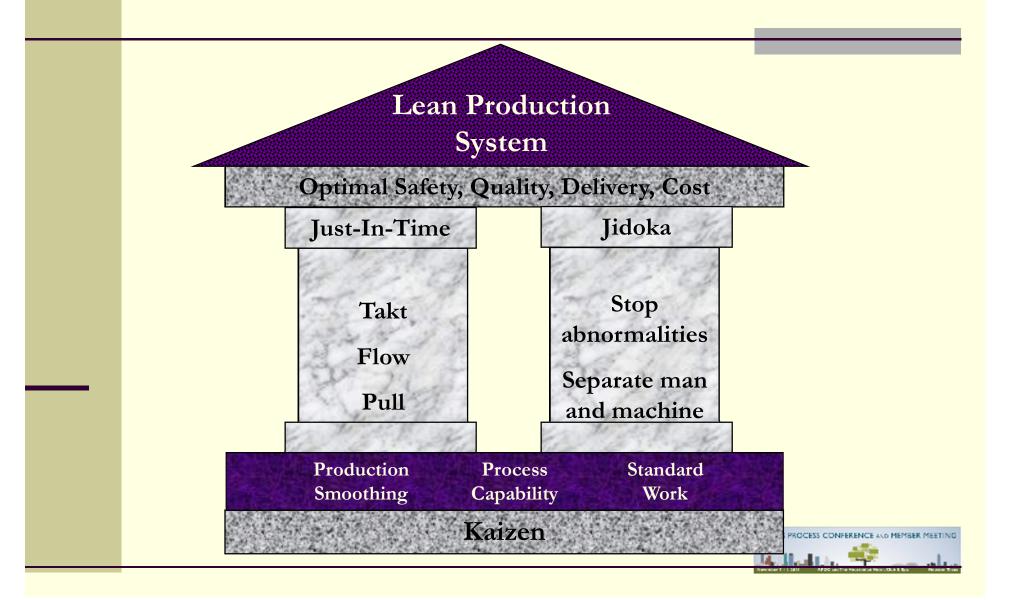

What is Kaizen

House of Lean

What is Kaizen

"Change for the better – continuously"

Lean Production System is the technical process of what to do to ensure optimal safety, quality, cost, and delivery.

Kaizen is how to do it.

Kaizen Event Roles & Responsibilities

- Sponsor Senior Level Manager The one who ultimately cares; who gives the event purpose. Removes barriers and provides accountability.
- Process Owner Area Manager The one who is ultimately responsible.
- Team Leader Anyone with facilitation skills The one who understands the Kaizen process and facilitates the team through the event
- CPI Coach Lean Expert The one who provides structure and coaching for the event; keeps the event moving and ensures followup support
- Team Members 1/3, 1/3, 1/3 rule The ones who identify and eliminate the waste, improving the process
- Coordinator Sets up event & obtains necessary supplies; makes sure that "nothing falls through the cracks"

Kaizen Event Principles

- Clear objectives
 - Defined scope and goals
- Team process
 - It is not a group of people charged with implementing management's plan
- Tight focus on time
 - Learn by doing, not discussing
- Quick & simple
 - Creativity over capital
- Necessary resources available
- Immediate results

Kaizen Event Ground Rules

- Keep an open mind to change
- Maintain a positive attitude
- Never leave in a silent disagreement
- Create a blameless environment
- Treat others as you want to be treated
- One person, one voice—no position or rank
- There's no such thing as a dumb question
- Strive for BETTER, not BEST
- When in doubt, observe and find out
- Understand the process and Just Do It!

Kaizen Event Week

Kaizen Breakthrough Methodology

Waste Walk

Analyze Current Work Processes

Map Existing State

Collect Baseline Data

Identify Wastes

Formulate Improvements

Team Leader Meeting

Begin improvement implementation

Solicit Involvement

Trystorming

Team Leader Meeting

Refine Improvements

Establish New Standard Operations

Train All
Operators New
Procedures

Run Full Production With Improvements

Validate Results

Recognition and Celebration

Present Results and Future Challenges

Establish 30-Day Homework

Kaizen Event Process

- Map the current state
- Collect baseline data
- Brainstorm improvement ideas
- Summarize ideas into Themes of Opportunity
- Map the future state
- Quick-kills & Go-forward plan

Business Process Challenges

- The process is rarely defined as a "process" the event scope is often just trying to understand the chaos
- The process normally involves multiple functional areas each with their own "personality"
- The process is seldom repetitive, making it hard to "see"
- The process is often difficult to measure or gather the typical metrics (productivity, quality, etc)
- Value Added vs Non-Value Added activities are often difficult to define
- Office people typically do not have standard work rules
- IT people rarely understand the business reasons for the system
 - they speak a different language

Phifer Example

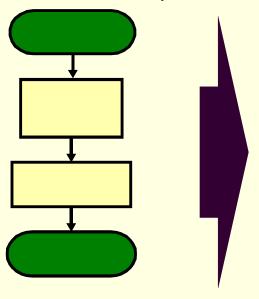

- Event Scope
 - From a material number request to the notification of the new material
- Sponsor was the COO
- Goal was to develop a go-forward plan
- Team Members
 - Good representation from each major area of the process
 - Included several members with a voice someone who wasn't afraid of diplomatically speaking up and questioning the current state.
 - The team leader was a good "translator"; someone who could speak to the physical process, the business process, and IT.

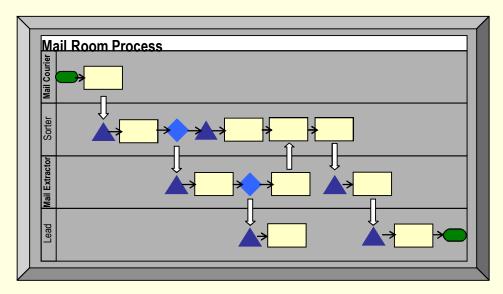

Step 1 – Mapping the Process

- 1) Create macro flow of the process
- 2) Determine the functional areas
- 3) Detail the process steps
- 4) Connect the steps with arrows

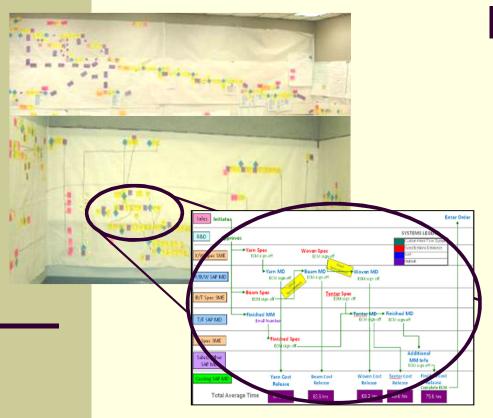

Step 1 – Mapping the Process

Success Tips

- Select the most common example to map
- Map at a level detailed enough for all team members to understand the process and the pain
- If the process is "big," create the map in subgroups
 - Define sections and subteams
- DO NOT map what team members
 THINK people do go to the actual doers or bring them to the map
- One sticky note per action
- Review often, especially if using subteams

Step 2 – Baseline Data

Item	Value
Average leadtime	4 days
Leadtime range	.7–39 days
# of people that touch the process	15
# of systems that touch the process	7
% of time information is wrong from prior step	22%
% of time information is missing from prior step	15%
# of requests per month	51
# material per week	38

Success Tips

- "Live" data instead of "dead" data
- Quantifies the process; quantifies the waste – speaks in executive language
- Ensure members understand and agree with the data

Produc	t Line	DF					5	2			5	4			TO	TAL

Step 3 – Themes of Opportunity

No Flow

- 23 handoffs; 15 people from 8 departments;
- 7 systems; Redundant data in multiple systems
- Data process was based on material states (production steps);
 Physical process is based on product lines
- No Ownership, Visibility, or Understanding
 - Requests were easily lost or stalled
 - Nobody was sure why they did what they did or how it was used
- Not User Friendly
 - One size fits all work flow that required IT programming to change
 - Many work-arounds
- No method to control the data or ensure its quality, accuracy, or consistency
 - Frequent, random changes from various areas
 - No enforceable rules to govern data entry

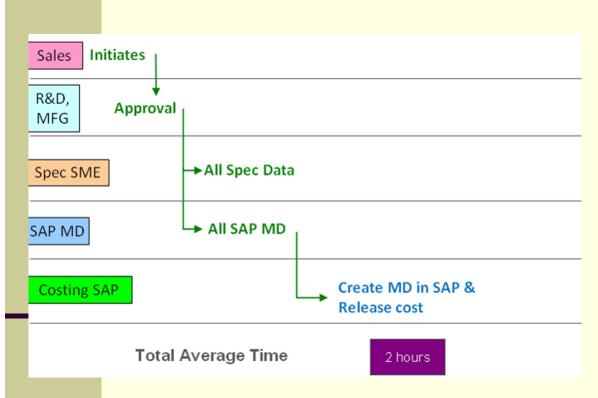

Step 3 – Improvement Ideas and Themes of Opportunity

- List ALL waste observations during the brainstorming session
- DO NOT discuss solutions or allow opportunities to be judged "good" or "bad"
- The more opportunities the better
- Narrow opportunities to only 4-6 Themes
 - These will be the areas to focus on to improve the process
 - Can be grouped by types of waste or by areas of the map
 - The team will be subgrouped by themes for the rest of the week
- This is the hardest part of the event; good facilitation through this process is critical
 - The CPI Coach and/or Team Leader can suggest the themes and let the team decide if they agree or not
 - Read through all the opportunities and let the team decide on the themes
- Ensure the themes address the event objectives

Step 4 – Future State Map

Success Tips

- Map as a whole group now is the time for the team to see it as a process and not individual, personal activities
- Start with only the Value Added steps
- Minimize hand-offs
- Make activities as standard as possible
- Create decision rules to ensure "quality at the source"

Step 5 – Quick Kills & Go Forward Plan

- Make sure the Themes of Opportunity address the gaps between the current state map and the future state.
- Create subgroups and assign each one a Theme
- Make as many changes (quick kills) to the current process as possible – minimize the follow-up activities
- Use an impact-difficulty matrix to prioritize actions

Step 5 – Go Forward Project Plan

Lessons Learned – General

- Kaizen events provide...
 - A process to follow that ensures objectivity
 - A neutral environment so everyone is on the same page
 - Deeper understanding of the problems and possibilities
 - Ownership of the changes by the areas being changed
- Business processes are different from shop floor processes in that they...
 - Involve several functional areas, often protected by border guards
 - Have communication gaps, politics, and personality clashes
 - Are not completely understood; even by those involved
- Improvements in business processes can have significant impact on the entire organization

Lessons Learned – IT Specific

- Ensure the business processes support the value-added activities, then ensure the IT systems support the business processes
- Software and programming should only be used to
 - automate *repetitive* steps
 - reduce complexity, especially by increasing visibility

NOT to

- solve communication and training problems
- accommodate process waste
- Let the translator do the talking
 - Often IT, business, and process improvement barriers are formed only because each person speaks a different language.

Questions
